Application Screenshots — Explanation for your demo

Slide 10 – Data Catalog & Glossary

What it does: This page helps users understand what datasets are available and what their columns and business terms mean. It helps data analysts discover available datasets and understand their structure. Instead of manually searching through database tables, users can refer to the catalog to understand the available data, columns and their meaning. This makes data discovery easier."

Slide 11 – Data Sources

What it does: Displays the data sources connected to the application and information about those sources.It gives users an overview of the connected sources and their details. This is important because our analytics workflow depends on knowing where the data comes from before processing or querying it."

Slide 12 – Ask & SQL: Query Results

What it does: Allows users to ask questions in natural language and view the resulting analytical.Users can enter a business question instead of manually writing SQL queries. The system processes the request and displays the query results in a structured table. This makes data analysis more accessible to users who may not have strong SQL knowledge."

Slide 13 – Ask & SQL: Successful Query

What it does: Here we can see the successful execution response. Once the question is processed and the required checks are completed, the system provides feedback and displays the result. This helps users understand whether their request was processed successfully.

Slide 14 – Ask & SQL: Query Review

What it does: Provides another view of the Ask & SQL workflow, including query-related information, part of our analytics workflow. Before relying on a result, users can review the query-related information presented by the application. The purpose is to make the natural-language analytics process more transparent rather than treating it like a black box.

Slide 15 – Gold Analytics

What it does: Displays analytics-ready information through a chart. The Gold layer contains processed and aggregated data that is ready for reporting and analysis. Here, users can visualize trends through charts instead of interpreting raw records. This helps convert processed data into useful business insights."

Slide 16 – Pipelines

What it does: Displays available data pipelines and their execution history and used to monitor our data pipelines. Users can view pipeline information and check previous execution records through the run history. It helps us understand whether data processing has completed successfully and track earlier runs.

Slide 17 – Quality & Drift

What it does: Displays data-quality information and possible changes in data patterns, checks help identify problems such as missing values, invalid records or other data inconsistencies. Drift detection helps identify changes in the data or its patterns over time. This is important because analytics results are only reliable when the underlying data is trustworthy.

Slide 18 – Alerts

What it does: Displays alerts and trend-related information, users monitor alerts generated by the system. It provides visibility into issues that may need attention. Instead of continuously checking every pipeline or process manually, users can refer to this page to identify important events.

Slide 19 – Monitoring Trend

What it does: Shows a monitoring trend over time, provides a trend view of the monitoring information. It helps users observe how a particular metric behaves over time and identify unusual changes. This is useful for understanding the overall operational health of the application.

Slide 20 – Monitoring Dashboard

What it does: Displays operational metrics related to the system and agent workflow. It provides an overview of the system's operational performance, including agent workflow activity, latency, execution time and other monitoring metrics. It helps us understand how the system is performing and identify possible bottlenecks.”

Slide 21 – Monitoring Metrics

What it does: Displays monitoring information through charts, pipeline freshness and integration or alert information, gives us a more detailed view of monitoring metrics. The charts help us understand execution activity, while the pipeline freshness and integration information help us track the status of different operations. It gives the team better visibility into system performance.

Slide 22 – API Latency

What it does: Displays API-related performance information which refers to the time taken by the backend to respond to a request. Monitoring this helps us identify slow responses and understand whether the application is responding efficiently.

Slide 23 – Users & Audit: User Management

What it does: Provides controls for managing users and their access.The user-management part allows authorized administrators to manage user access and roles. This is important because not every user should have permission to perform every operation in the system.

Slide 24 – Users & Audit: Records

What it does: Displays user-related records and audit information.Here we can view user-related records maintained by the application. These records help administrators understand user activity and maintain accountability. It supports governance by providing visibility into who is using the system.

Slide 25 – Users & Audit: Audit Logs

What it does: Displays recorded activities and audit details.It helps us track activities performed within the system, including relevant information about the action, user and execution outcome. Audit logs are important for tracing activities, investigating issues and maintaining accountability.”
